Advanced IT Training System

Overview, Certification Procedures, Examination for Professionals

- >> The new work-process oriented Advanced IT Training System provides companies with an efficient form of staff training and with an excellent tool of staff promotion. IT practitioners and those having entered the sector without an IT-specific educational background, are offered an opportunity for a workflow-embedded upgrading of their competencies. It thus opens up attractive job chances and career opportunities.
- >> Process descriptions were used to clearly define the 29 IT specialist profiles. Training being carried out in the workplace and in the context of actual projects aims at high professional competency. It concludes with a private-sector certification following the internationally valid standard DIN EN ISO/IEC 17024.
- >> Operative and strategic professionals pass an examination which is regulated by public law at their local Chamber of Industry and Commerce. Their training is done on the job. The professional degrees are comparable to Bachelor and Master level. The recognition by universities and universities of applied sciences of these professional degrees is being attempted by applying a credit point system.
